

# Near-Online Multi-target Tracking with Aggregated Local Flow Descriptor

W. Choi (ICCV 2015)

- ▶ Near-Online Multi-target Tracking (NOMT) algorithm formulated as global data association between targets and detections in temporal window
- ▶ Designing an accurate affinity measure to associate detections and estimate the likelihood of matching
- ▶ Aggregated Local Flow Descriptor (ALFD) encodes the relative motion pattern using long term interest point trajectories
- ▶ Integration of multiple cues including ALFD metric, target dynamics, appearance similarity and long term trajectory regularization
- ▶ Solves the association problem with a parallelized junction tree algorithm
- ▶ Best accuracy with significant margins on KITTI and MOT dataset
