

# Fast Optical Flow using Dense Inverse Search

T. Kroeger, R. Timofte, D. Dai, L. V. Gool (Arxiv 2016)

## Algorithm 1 Dense Inverse Search (DIS)

- 1: Set initial flow field  $\mathbf{U}_{\theta_{ss}+1} \leftarrow \mathbf{0}$
- 2: **for**  $s = \theta_{ss}$  to  $\theta_{sf}$  **do**
- 3:   (1.) Create uniform grid of  $N_s$  patches
- 4:   (2.) Initialize displacements from  $\mathbf{U}_{s+1}$
- 5:   **for**  $i = 1$  to  $N_s$  **do**
- 6:     (3.) Inverse search for patch  $i$
- 7:   (4.) Densification: Compute dense flow field  $\mathbf{U}_s$
- 8:   (5.) Variational refinement of  $\mathbf{U}_s$

- ▶ Very low time complexity for dense optical flow
- ▶ Inverse search for a uniform grid of patch correspondences
  - ▶ Inverse Lukas-Kanade algorithm proposed before
- ▶ Dense displacement field creation through patch aggregation along multiple scales
  - ▶ Coarse-to-fine scheme
  - ▶ Densification as weighted averaging to displacement estimates
- ▶ Variational refinement
- ▶ 300Hz up to 600Hz on a single CPU core (human-level temporal resolution)
- ▶ Evaluated on Sintel and KITTI benchmarks
