

# Semantic Visual Localization

Johannes L. Schönberger<sup>1</sup> Marc Pollefeys<sup>1,3</sup> Andreas Geiger<sup>1,2</sup> Torsten Sattler<sup>1</sup>

## Motivation

**Goal:** Given a visual image, localize within an existing map.

Robust visual localization under a wide range of viewing conditions is a fundamental problem in computer vision.

Handling the difficult cases of this problem is challenging due to:

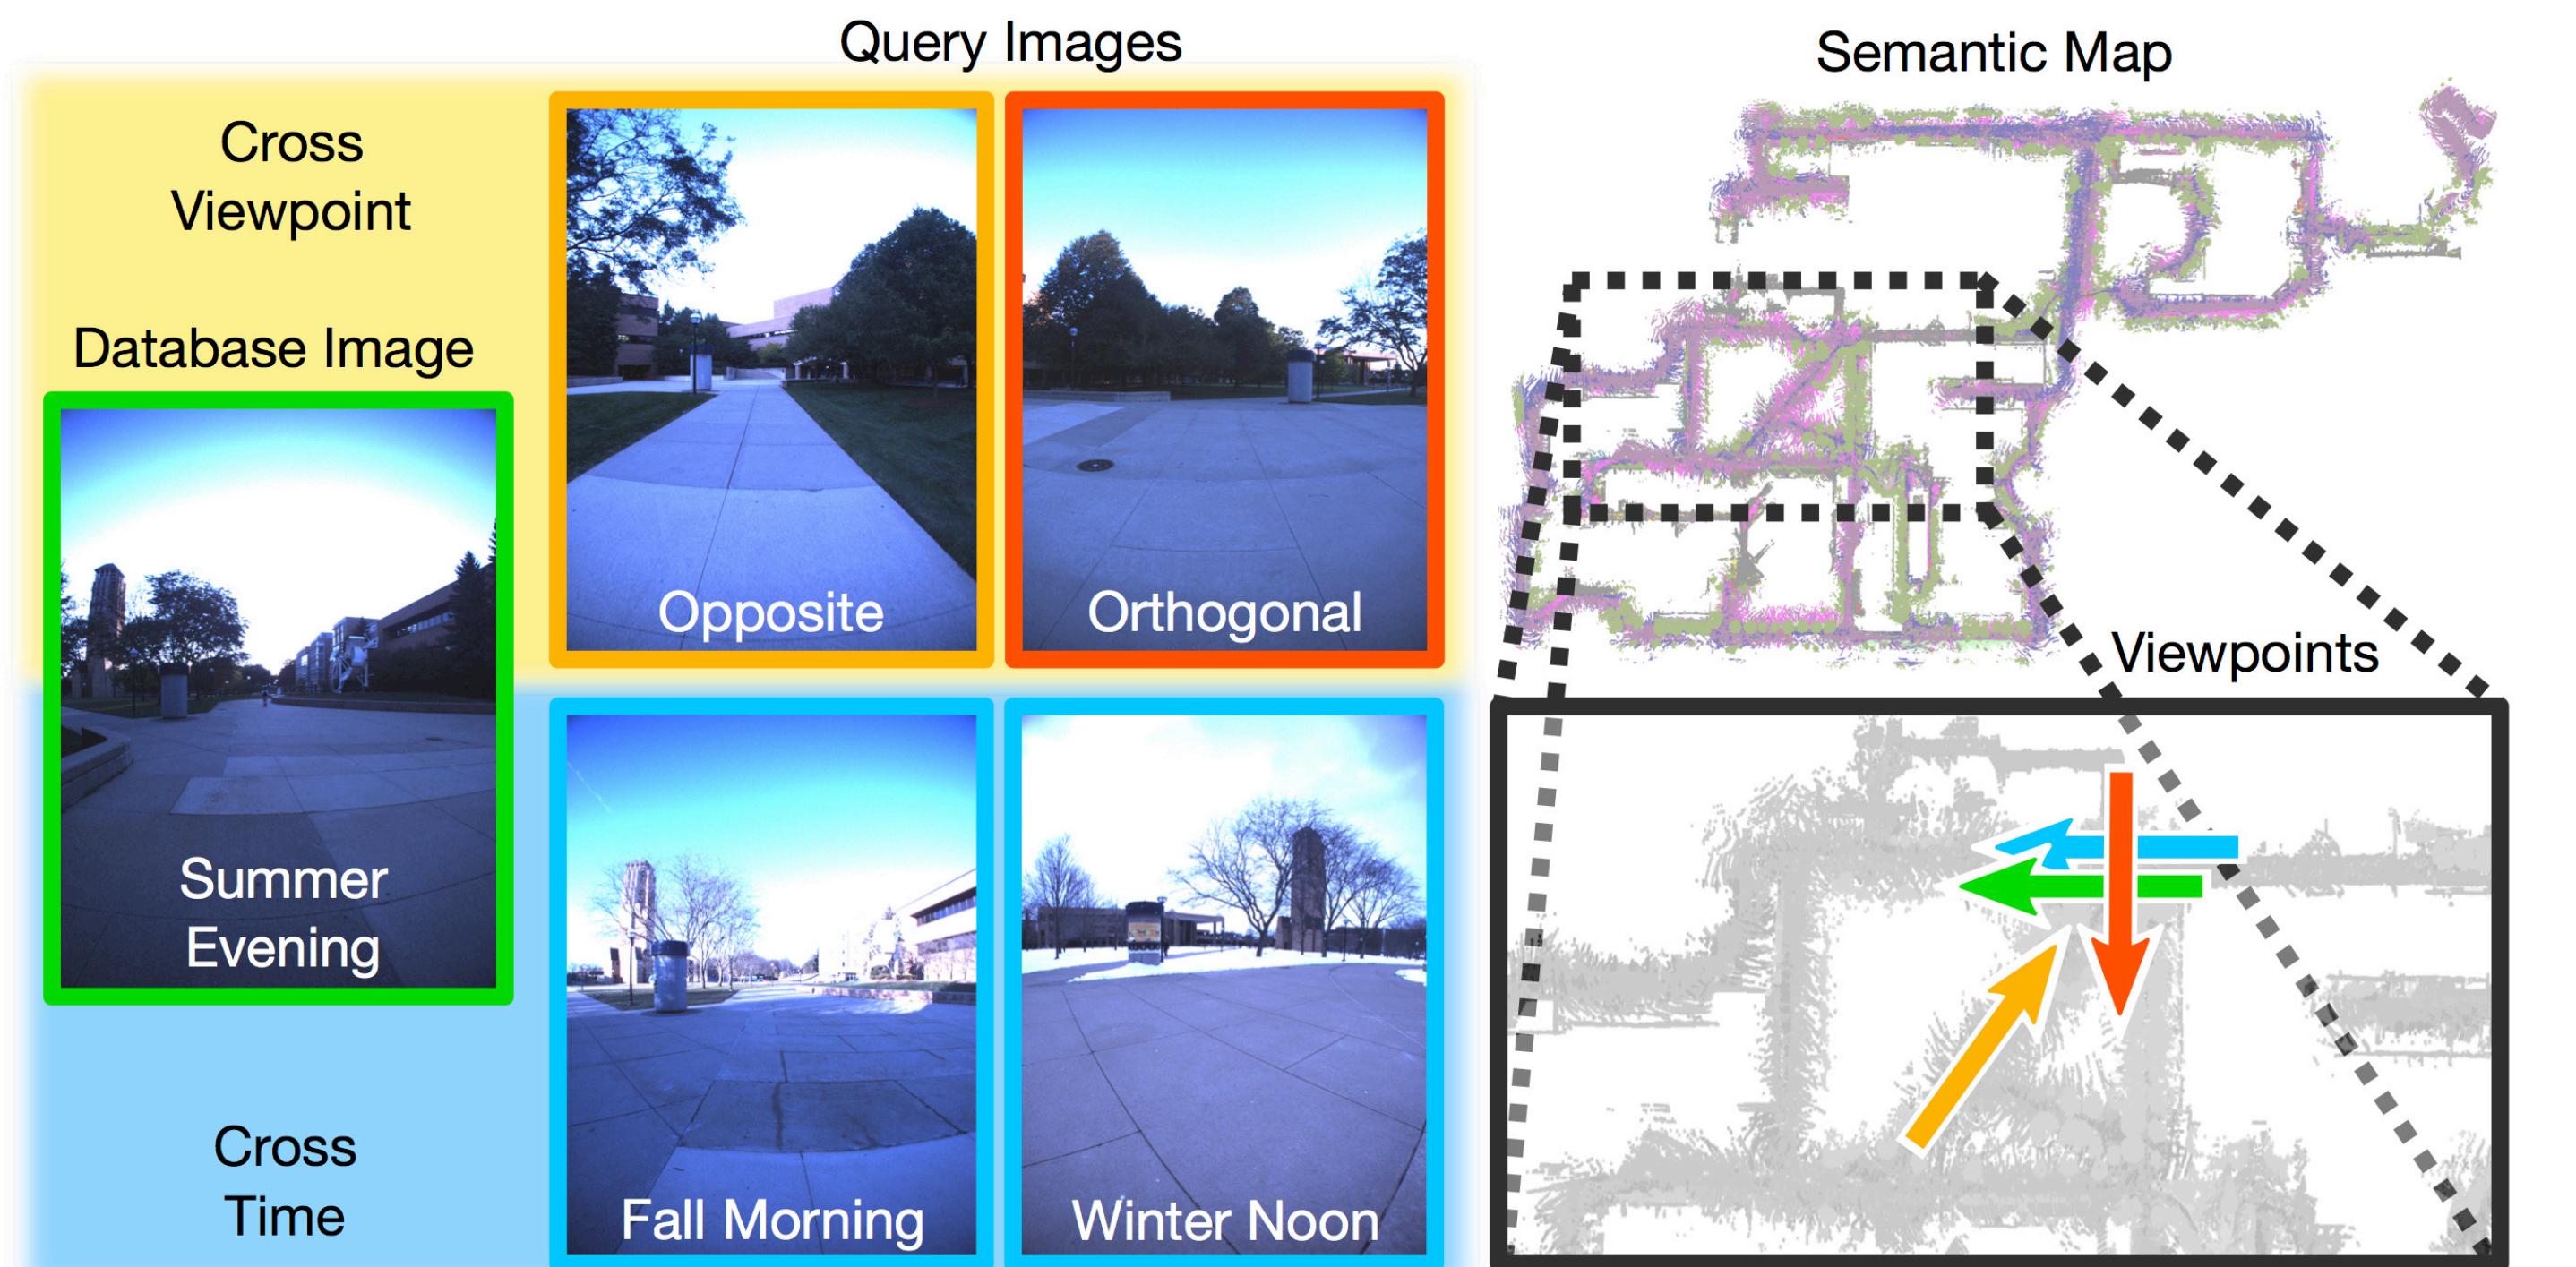

- Viewpoint changes
- Illumination changes
- Geometry changes

High practical relevance for life-long localization in:

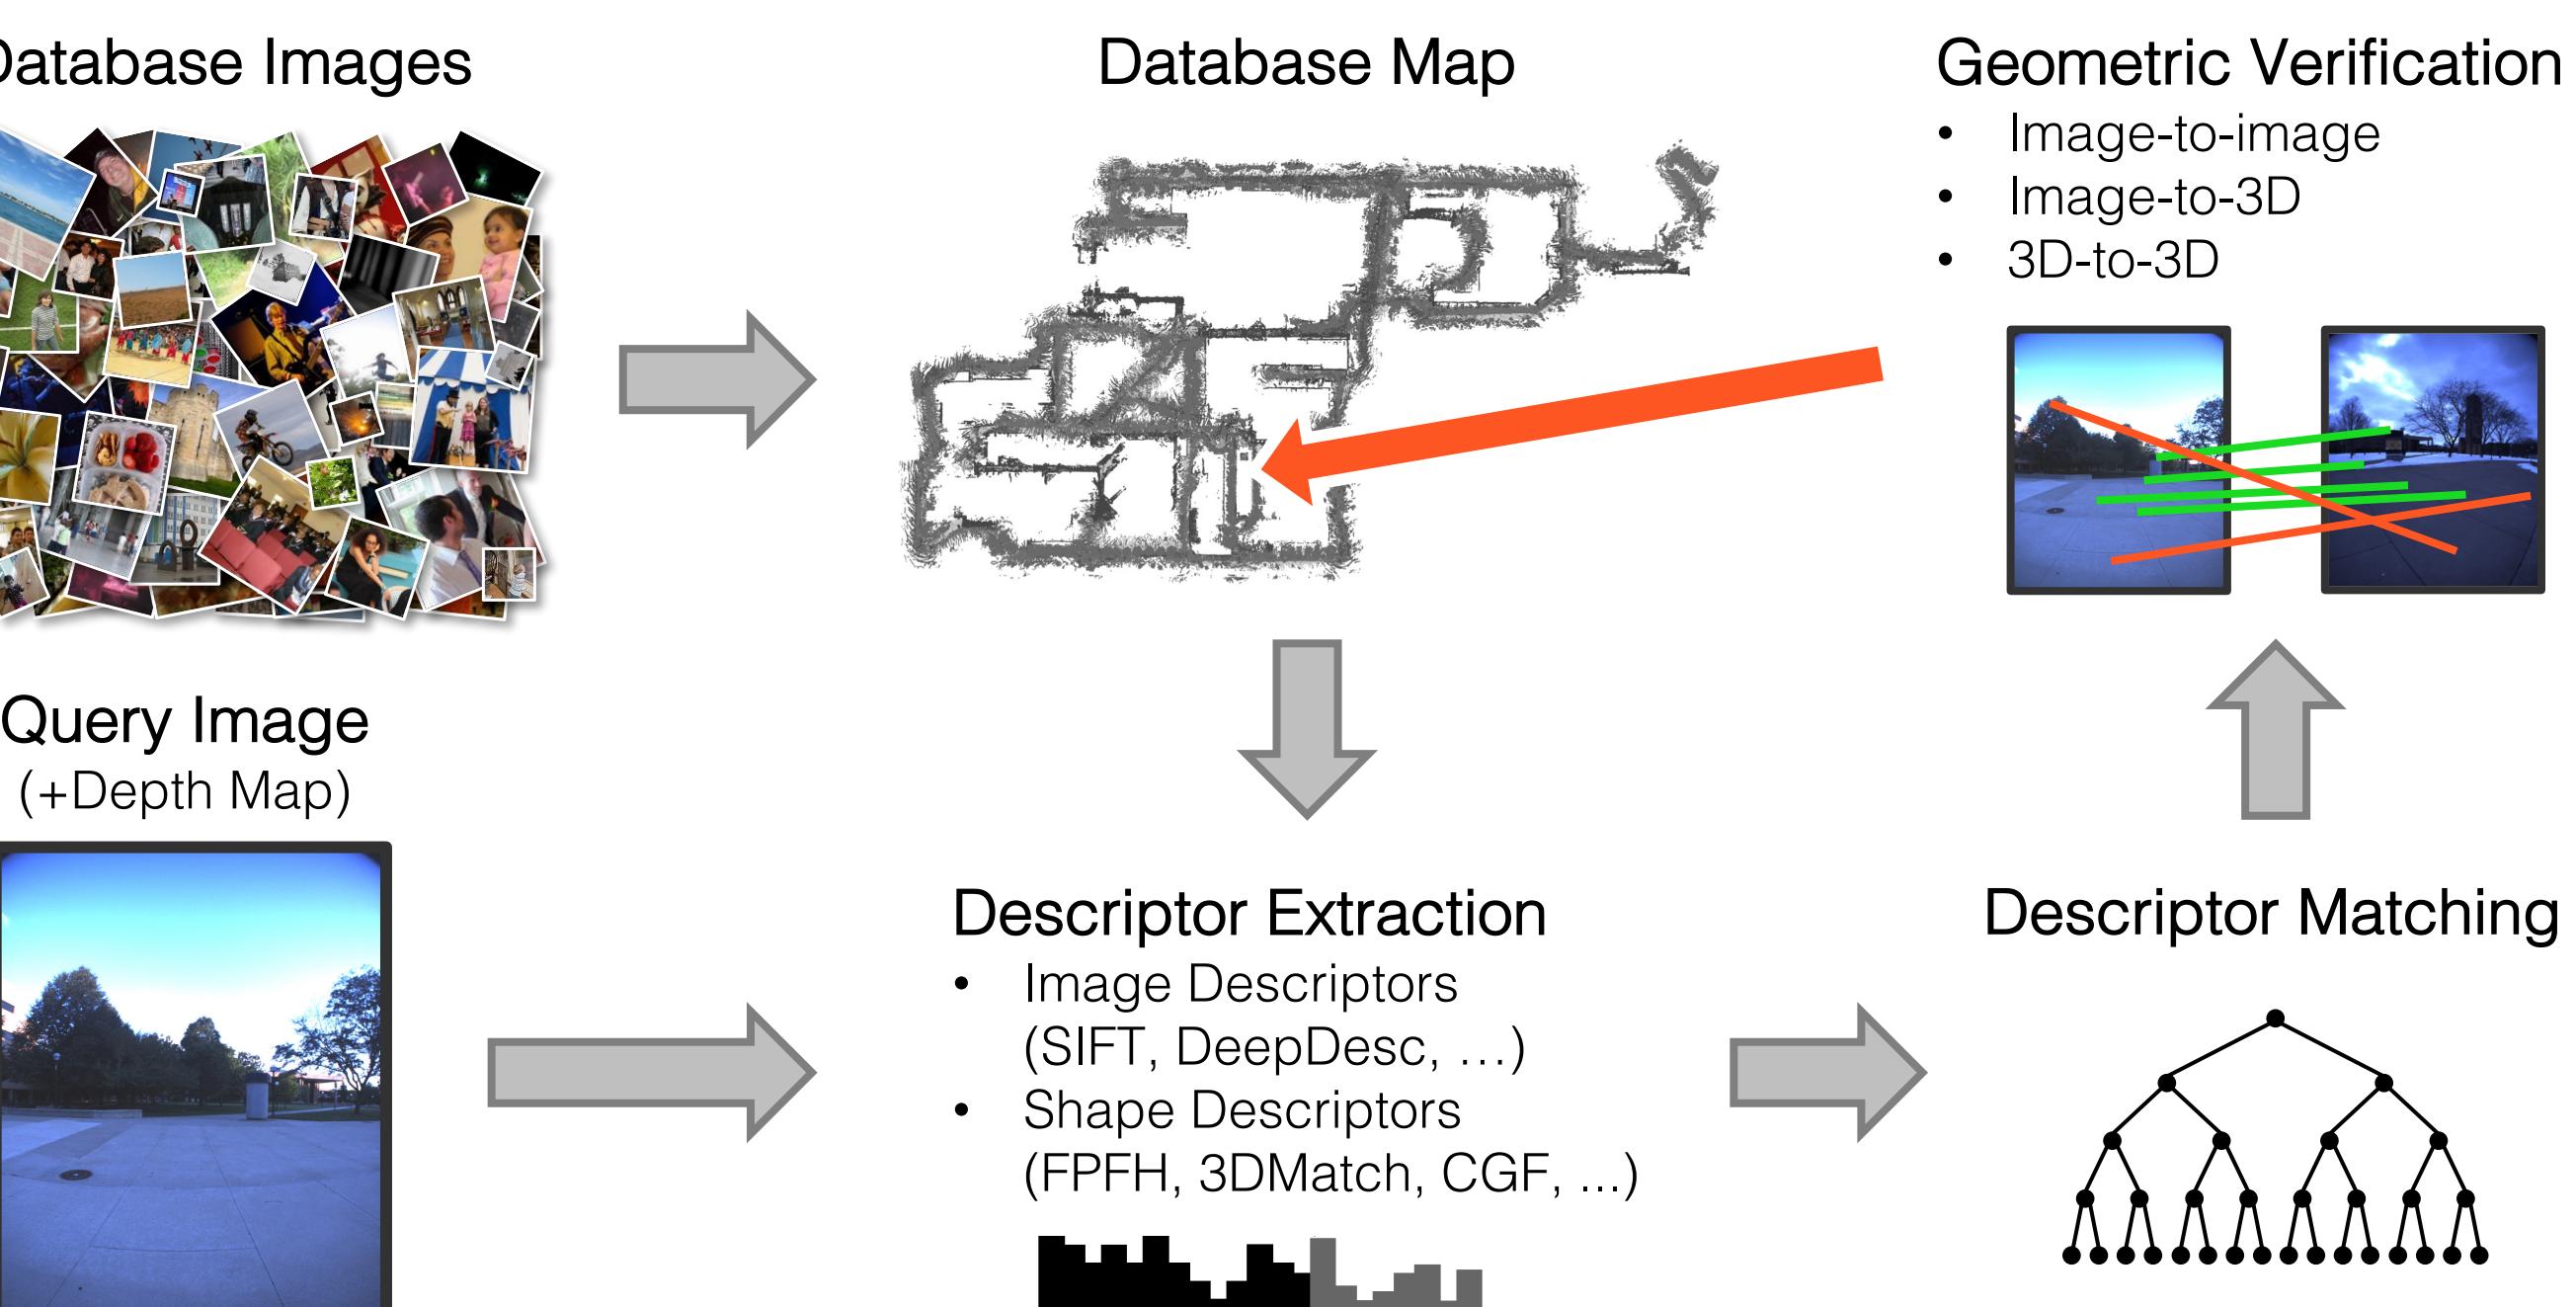

- AR/VR applications
- Autonomous robots

## Contributions

- Generative descriptor learning on 3D semantic scene completion task
- Joint geometric / semantic descriptors and 3D semantic alignment
- Robust localization under extreme viewpoint / illumination changes

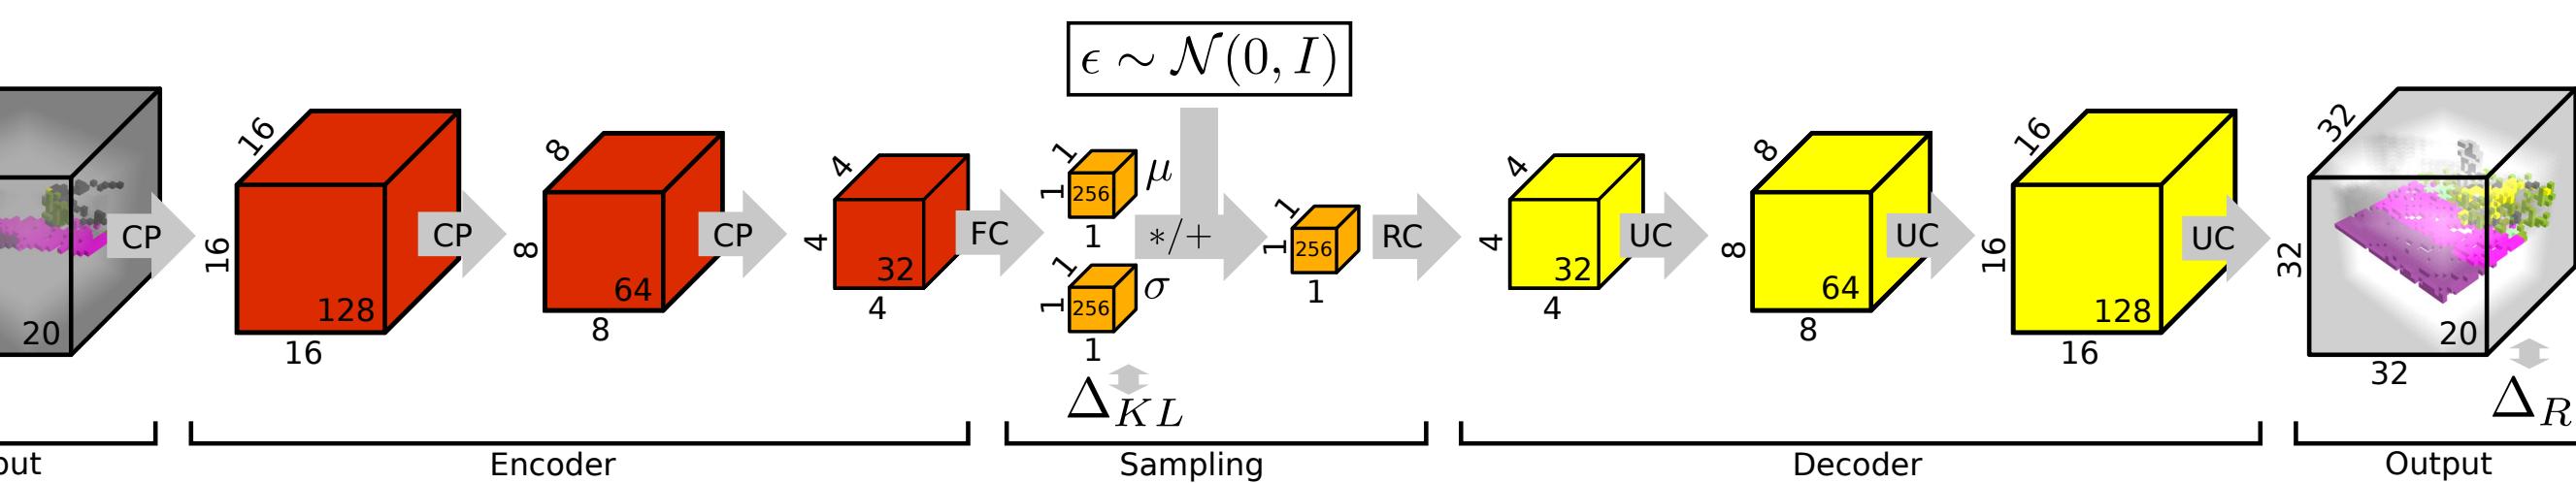

## Traditional Methods

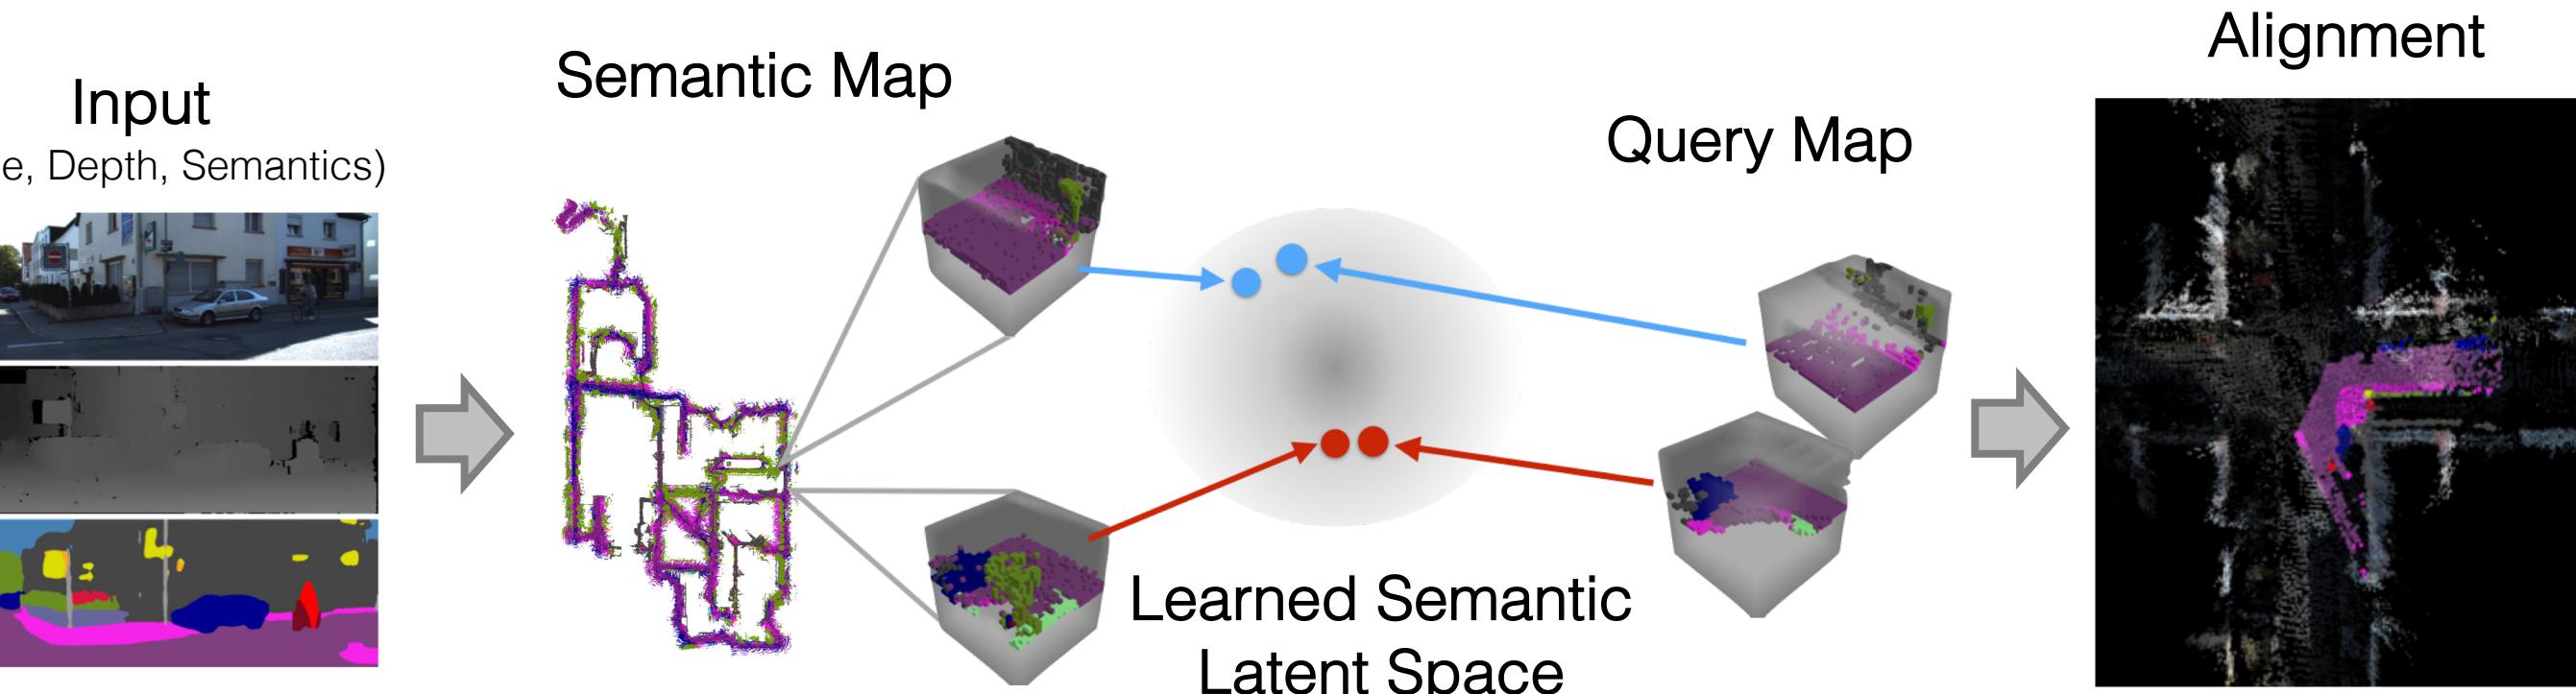

## Proposed System

### Generative descriptor learning

- Semantic scene completion as auxiliary task

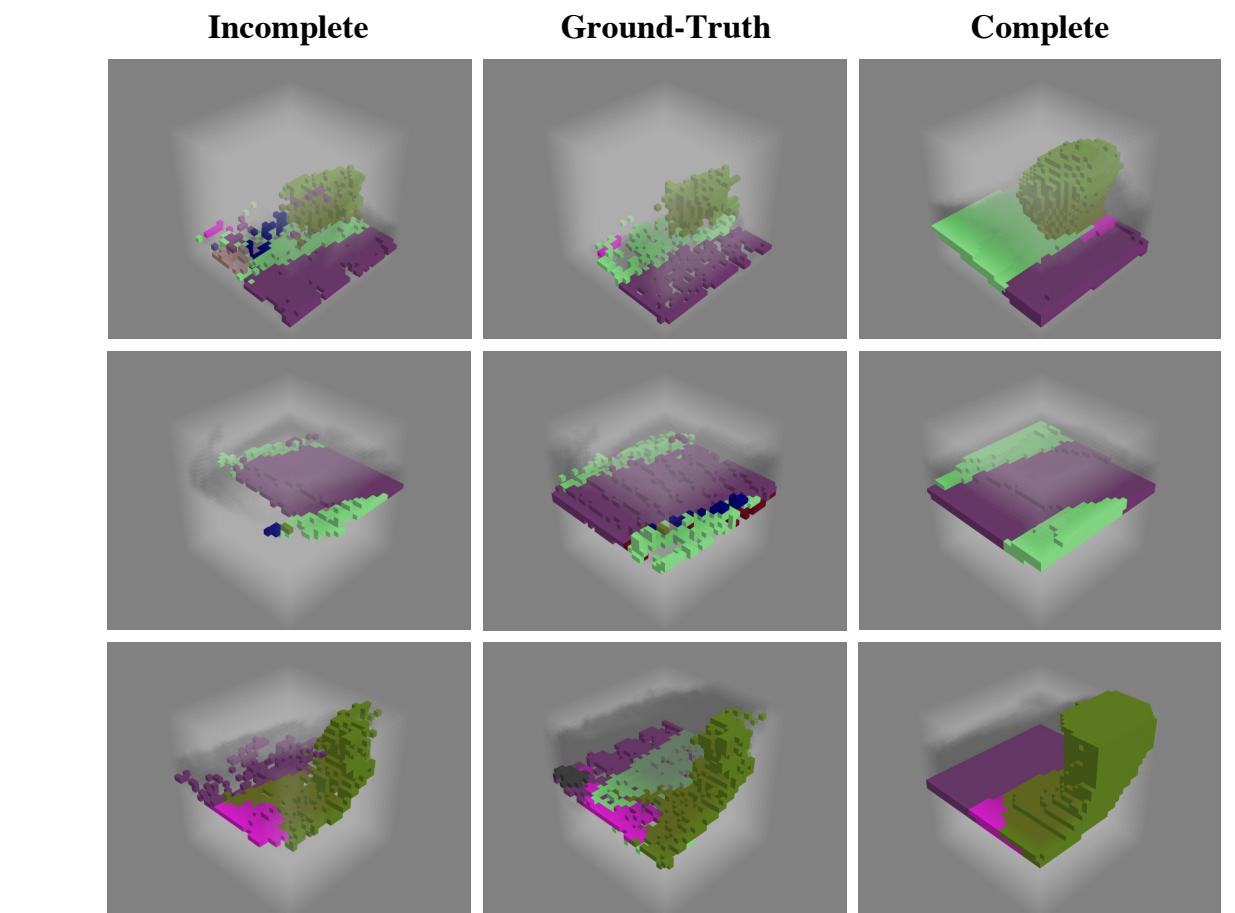

### Joint geometric and semantic matching and alignment

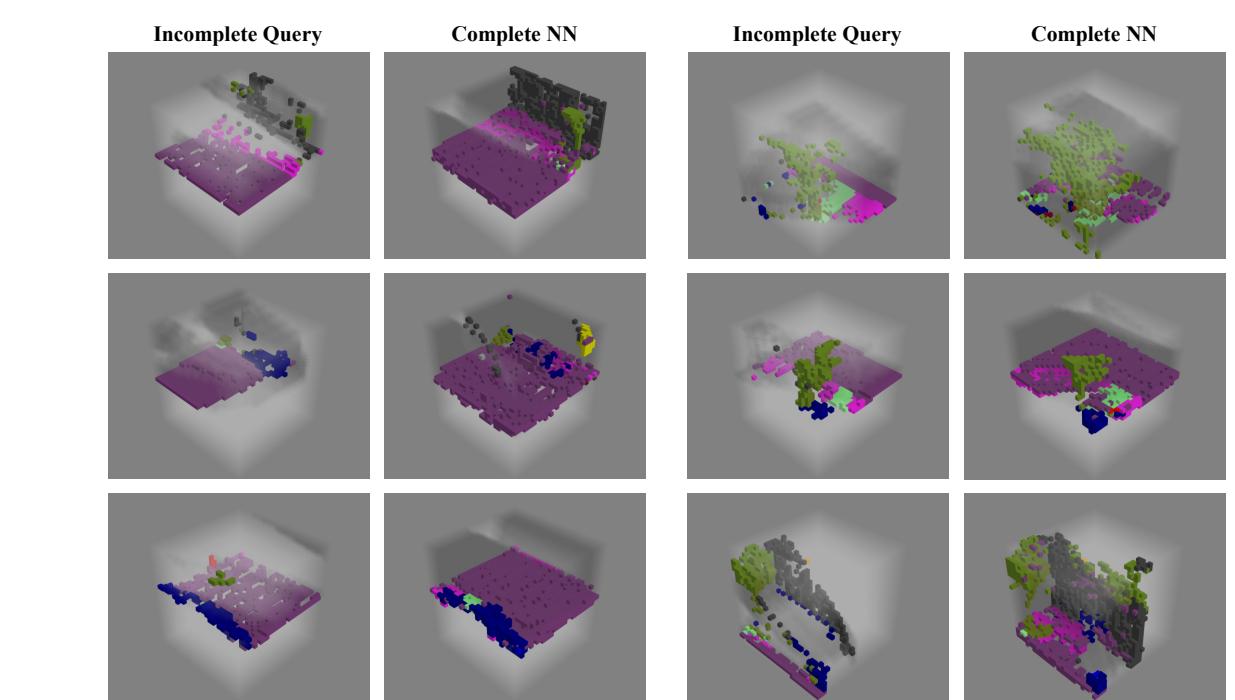

## Results

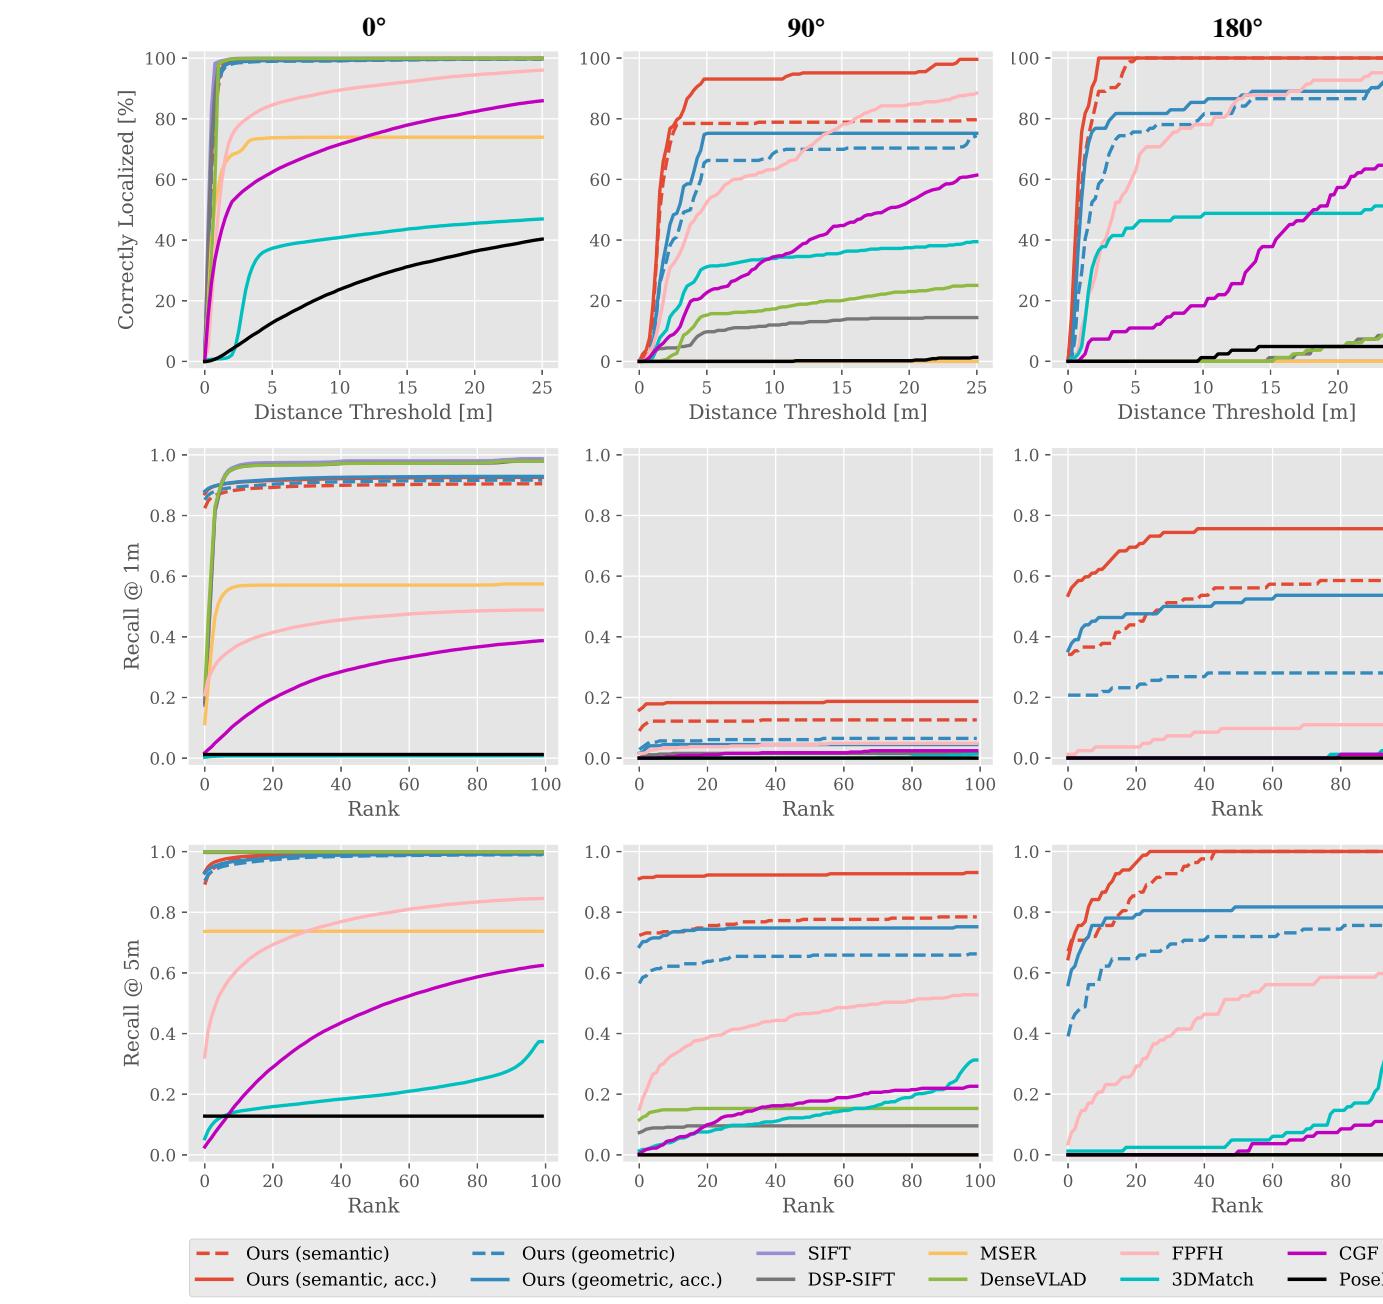

### Semantic scene completion

### Matched nearest neighbors

### Cross-viewpoint localization (KITTI odometry sequences)

### Cross-season localization (NCLT campus sequences)
