

Map-Based Probabilistic Visual Self-Localization

M. A. Brubaker, A. Geiger, R. Urtasun (PAMI 2016)

- ▶ Describes an affordable solution to vehicle self-localization which uses odometry computed from two video cameras & road maps as the sole inputs
- ▶ Contributions:
 - ▶ Proposes a probabilistic model for which an efficient approximate inference algorithm is derived
 - ▶ The inference algorithm is able to utilize distributed computation in order to meet the real-time requirements of autonomous systems
 - ▶ Exploits freely available maps & visual odometry measurements, and is able to localize a vehicle to 4m on average after 52 seconds of driving
- ▶ Evaluates on KITTI visual odometry dataset
