Instance-aware Semantic Segmentation via Multi-task Network Cascades Jifeng Dai, Kaiming He and Jian Sun (CVPR 2016)

- Limitations of existing methods for instance segmentation using CNNs
 - ▶ Slow at inference time because they require mask propasal methods
 - Don't take advantage of deep features and large amount of training data
- End-to-end training of Multi-task Network Cascades for 3 tasks of differentiating instances, estimating masks & categorizing objects
- ► Two orders of magnitude faster than previous systems
- ► State-of-the-art on PASCAL VOC & MS COCO 2015
