

Stereo Visual Odometry Without Temporal Filtering

J. Deigmoeller and J. Eggert (GCPR 2016)

- ▶ Ego-motion estimation from stereo avoiding temporal filtering and relying exclusively on pure measurements
- ▶ Stereo camera set-up is the easiest and leads currently to the most accurate results
- ▶ Two parts
 - ▶ Scene flow estimation with a combination of disparity and optical flow on Harris corners
 - ▶ Pose estimation with a P6P method (perspective from 6 points) encapsulated in a RANSAC framework
- ▶ Careful selections of precise measurements by purely varying geometric constraints on optical flow measure
- ▶ Slim method within the top ranks of KITTI without filtering like bundle adjustment or Kalman filtering
