

Spatial Ray Features for Real-Time Ego-Lane Extraction

T. Kühnl, F. Kummert, and J. Fritsch (IV 2012)

- ▶ Road classification in unconstrained environments
- ▶ Extending local appearance-based road classification with a spatial feature generation and classification
- ▶ Local properties from base classifiers on patches from monocular camera images
- ▶ Output of classifiers represented in a metric confidence map
- ▶ Spatial ray features (SPRAY) from these confidence maps
- ▶ Final road-terrain classification based on local visual properties and their spatial layout
- ▶ No an explicit lane model
- ▶ In real-time with approximately 25 Hz on a GPU
